

OBSCURA

Four tools. One laptop. Zero cloud.

Open-source AI for the clinics America runs on

2 hours at a desk for every 1 hour with a patient.

That's a doctor's day now — and one in five say they intend to leave medicine within two years.

AMA time-motion study, Annals of Internal Medicine · intent-to-leave: Mayo Clinic Proceedings physician survey

The clinics that need AI most are the ones that can't use it.

Cloud AI costs hundreds per doctor per month · won't sign a HIPAA agreement · assumes an IT department

The upload is the breach.

Sending a patient record to a cloud AI to ask “what’s sensitive?” is itself the disclosure.

Open models changed everything.

Gemma 4 · Apache-2.0 · frontier reasoning on a stock laptop — no account, no fee, no network

One engine. Four prongs.

- | | | |
|----|-------------------|------------------------------------|
| 01 | Transcribe | The visit writes itself. |
| 02 | Redact | Share the record, not the patient. |
| 03 | Secure | A \$0 IT department. |
| 04 | Organize | Files that name themselves. |

AI proposes. A human approves. It verifies itself.

Everything happens inside the laptop.

● Network egress: 0 — pull the Wi-Fi and everything still works.

It destroys data — and proves it.

0

recoverable characters after redaction

18

HIPAA Safe Harbor identifiers in the coverage panel

4

self-run verification checks on every export

Select-all · text-search · re-OCR · metadata audit — the tool attacks its own output before you trust it

Free. Forever. For everyone.

Apache-2.0 · runs on the laptop the clinic already owns

Cloud AI scribes run \$299–\$1,512 per doctor, per month. Redaction suites, \$279+/user. IT support, \$150/user.
Obscura replaces that stack at \$0 — for the clinics the \$300M cloud-scribe market doesn't serve.

This is what the time is for.

*As fast as AI.
As private as a locked filing cabinet.*

Open models made this inevitable. We just built it first.
